Retail market intelligence

Tamil Nadu (synthetic scenario) | Monthly sales estimate | 08 Nov 2026

Executive summary

This report estimates monthly FMCG retail sales from a simulated, stratified store survey. Figures are instructional, not actual market measurements or NIQ outputs.

Estimated monthly sales
INR 1,390.10 Cr

Stores in assumed universe
9,600

Estimated sales interval
INR 1,296.60 Cr to INR 1,483.61 Cr

Surveyed / response rate
720 / 99.0%

Regional estimates

Market	Stores	Responses	Sales (INR Cr)	95% interval (Cr)
Chennai	3,034	225	532.3	474.1 - 590.4
Coimbatore	1,794	135	281.7	221.4 - 342.1
Madurai	1,549	115	220.5	188.7 - 252.2
Tiruchirappalli	1,275	96	144.1	130.7 - 157.4
Salem	1,021	73	114.0	94.6 - 133.5
Tirunelveli	927	69	97.5	85.1 - 110.0

Intervals indicate modelled sampling uncertainty under the stated survey assumptions; they do not capture coverage, measurement or nonresponse bias.

Methodology & quality

Survey design

Synthetic finite population with store-level monthly FMCG sales; independent simple random samples without replacement within region-by-store-type strata. The population counts are assumed known for this demonstration. Store counts are not themselves estimated from an incomplete retail frame.

Estimation

For each stratum, estimated market sales = population store count multiplied by the mean sales among responding sampled stores. The sum of stratum estimates gives the selected market total. Within-stratum respondent counts are used to adjust for simulated missing sales, which requires a missing-at-random-within-stratum assumption.

Uncertainty

Two-sided 95% normal-approximation confidence intervals are calculated from the sum of stratum variances with finite-population correction. These intervals are approximate, particularly with small samples or non-random nonresponse.

Data quality & study scope

Selected sample: 720 stores; missing sales submissions: 7; responding stores: 713; analysis seed: 77.

Included store formats: Kirana, Mini market, Supermarket, Hypermarket.

Interpretation and next steps

- Use regional estimates to prioritise fieldwork and identify imprecise markets.

- Review low-response strata, unexpected sales values and coverage gaps before communicating results.

- To use this in a real retail index, validate the store universe, fieldwork design, data governance and frame quality; add appropriate nonresponse and calibration procedures.

Important: All stores, regional totals and sales values in this project are simulated. Not affiliated with or endorsed by NielsenIQ.
